CALL FOR PARTICIPATION

Hermes Partnership is a joint international initiative of a number of European universities and (industrial) research laboratories. Common interest of Hermes Partners is Wireless Communications and Wireless Networks.

Hermes Partners, together with other parties, carries out a huge number of research projects, in particular in the area of Intelligent Telecommunications and Telecommunications Applications. The role of Hermes Partnership is to address potential research directions, Hermes it selves is not a player during the execution of the projects. More on Hermes Partnership: www.hermes-europe.com

One of the methods to address new research directions is by organizing technical workshops.

During a recent Hermes technical meeting we had a discussion on the possible role of advanced Wireless Communication Technologies in "Smart Energy Grid Concepts". We are convinced robust advanced sensor technology, making use of robust wireless techniques, can play a role in the further development of Smart Energy Grid. In particular robustness with respect to secure response speed, security and other, probably can contribute to optimal Smart Grid Energy Concepts.

During the technical meeting we concluded the need for knowledge exchange with experts from Energy Production and Energy Transportation area.

In a compact workshop with experts from the Energy sector we will discuss the role of wireless communications and networks in Smart Energy Technical Concepts.

External parties representing the energy productions and energy transport sector are will be invited to participate in the meeting.

The compact workshop is scheduled begin February 2013. The workshop will be international, probably organized in Amsterdam or Geneva.
